

Because of the limit of time and personal ability, I may not be able to complete this question before the deadline. However, after reading this paper, I have some thoughts as follows.

1. The author explains the difference between highly interpretable models and black box machine learning models for high stakes decisions, and the problems that the former may cause.
2. The author encourages people to use interpretable models (especially needed in high stakes decisions).
3. This paper is a combination of technical and philosophical views.
